# SOA

# SOAP and WS-\*

- Composable
  - WS-Security, ReliableMessaging, etc
- Transport independent
- Tooling
- Schemas and WSDLs
  - Governance

# REST

# HATEOAS

201 Created

Location: <http://starbucks.example.org/order/1234>

Content-Type: application/xml

Content-Length: ...

```
<order xmlns="http://starbucks.example.org/">
  <drink>latte</drink>
  <cost>3.00</cost>
  <next xmlns="http://example.org/state-machine"
    rel="http://starbucks.example.org/payment"
    uri="https://starbucks.example.com/payment/order/1234"
    type="application/xml"/>
</order>
```

IT ARCHITECTURE IS NOT ALWAYS SIMPLE

FORTUNATELY...

... MOST OF THE TIME IT IS

# Design Governance

- Interfacing SOA into the build/test/production
- Encouraging Service Re-Use
- Lifecycle and Dependency Management
- Notification

# Runtime Governance

- Monitoring
- SLA management
- Correlation of activities into flows
- How do you maintain a running application when it depends on 10s, 100s or 1000s of remote services?

# Services vs APIs

- Focus on the consumer
  - Self-signup and subscription
  - Tracking and usage
  - Developer portals and ease-of-use
  - Monetization

**1990s and earlier**

**Pre-SOA (monolithic)**  
Tight coupling

For a monolith to change, all must agree on each change. Each change has unanticipated effects requiring careful testing beforehand.

**2000s**

**Traditional SOA**  
Looser coupling

Elements in SOA are developed more autonomously but must be coordinated with others to fit into the overall design.

**2010s**

**Microservices**  
Decoupled

Developers can create and activate new microservices without prior coordination with others. Their adherence to MSA principles makes continuous delivery of new or modified services possible.

# ESBs and Intermediaries

- ESB Patterns
  - Façade
  - Hub
  - Federated
  - Monitoring point
  - Transformation
- ESB vs Registry or both?
  - Or a utopia where every service works directly with every other?

# Orchestration and Composition

- BPMN, BPEL
- Executable Documentation?
- Visibility and Monitoring

# Design Considerations

- Granularity of Services
  - Microservices
  - Monolith First? Microservice First?
- Ensuring that SOA is being used for a good reason:
  - Scale
  - Organizational boundaries
  - Evolvability
- Where to draw the boundaries?
  - Between services
  - Between microservices and services
  - Between ESB and BPM
  - Between organizations
- Are your layers right?

# Organizational issues

- Funding models
- Fiefdoms
- Ecosystems / Value Webs
- Shadow IT / Cloud

## THE BENEFITS OF A SOA

# SOA and Cloud

- SOA is loose-coupling between applications and applications
- Cloud is loose-coupling between applications and infrastructure

# What else?
